

Are you looking for a new approach to treating PTSD symptoms?

Researchers at the PVAMC are conducting a study to see if a low level electrical current to the head makes it easier to experience virtual reality scenes from Iraq or Afghanistan. The ultimate goal is to improve and shorten treatment for PTSD.

Study Involvement:

- Up to 3 MRI scans
- 1 Optional EEG session
- 6 Virtual Reality sessions with low level electrical brain stimulation
- Up to **\$425** for completing the study
